## Java Exception Handling

### Objective

- Java Exceptions, Java Exception Handling, Java throw and throws, Java catch Multiple Exceptions, Java try-with-resources, Java Annotations, Java Annotation Types

### Business needs

- TBD

### Working requirements

- Working environment: Eclipse IDE.
- Delivery: Source code, deployment and testing, reviewing evident packaged in a compress archive.

### Product architecture

- N/A

### Technologies

The product implements one or more technology:

- Java basics
- Java Exception

### Stored Data

- N/A

**Exercise 1:**

Create a class with a main( ) that throws an object of class Exception inside a try block. Give the constructor for Exception a String argument. Catch the exception inside a catch clause and print the String argument. Add a finally clause and print a message to prove you were there.

**Exercise 2:**

Create your own exception class using the extends keyword. Write a constructor for this class that takes a String argument and stores it inside the object with a String reference. Write a method that prints out the stored String. Create a try-catch clause to exercise your new exception.

**Exercise 3:**

Create a three-level hierarchy of exceptions. Now create a base-class A with a method that throws an exception at the base of your hierarchy. Inherit B from A and override the method so it throws an exception at level two of your hierarchy. Repeat by inheriting class C from B. In main( ), create a C and upcast it to A, then call the method.

**-- THE END --**
